## FIRST RESPONDER DUTY RIFLE PROGRAM

### MISSION STATEMENT

WATCHTOWER stands firmly behind our protectors. Our leadership team is comprised of former service members, so we understand the sacrifices that you and your families make for our country. Our firearms are specifically designed and engineered to meet the most rigorous demands and WATCHTOWER is firmly committed to supporting you and providing unmatched customer service.

### VALUES STATEMENT

WATCHTOWER is a brand that never offers excuses; believes deeply in personal responsibility and accountability; is made for those who do not compromise; values self-reliance; and understands America is not just a place but an idea that must be defended with our sacred honor.

The WATCHTOWER “We have your back guarantee,” if your duty rifle, SBR, or suppressor is lost, stolen, damaged, seized, or destroyed in the line of duty, we will repair or replace the item at no-cost.

Welcome to the next great American firearms company.

Arc-PVD or physical vapor deposition is the process in which a high-powered electric arc is discharged, in a vacuum environment, into a solid target of material made from a refractory metal. Refractory metals are metals that have an exceptionally high resistance to heat and wear. This arc causes explosive evaporation of the target material. This ionized material reacts with the various gasses being injected into the chamber before being deposited, at the molecular level, onto the workpieces which are orbiting around the target material.

The PVD coating thickness is commonly measured in microns which is one-twenty-five thousandths of an inch (.00004). Comparatively, a standard piece of printer paper is typically around .003 or 3-thousandths of an inch. All PVD coatings we currently offer are around .0001, or one ten thousandths of an inch which is dimensionally insignificant. The coating can be made thicker or thinner with more or less time in the machine regardless of the chemical gas makeup. The process is extremely delicate though. If the coating applied is too thick for the application, it can chip and fail under normal operating conditions. Applied too thin and the coating loses its functional properties becoming purely decorative. It is imperative that each individual components be tested thoroughly with a well-rounded base coating to determine if changes need to be made. Some parts require a dedicated coating “recipe” to meet specific demands.

PVD lubricity is expressed as Coefficient of Friction (CoF); which is simply the amount of friction between two surfaces. In WATCHTOWER’s firearm applications, the benefits of the PVD coating can be seen in the interaction between the Bolt Carrier Group (BCG) and the upper receiver/buffer tube, BCG, and hammer as well as the bolt lugs of the BCG during lock-up and ejection within the barrel extension. PVD on a properly finished surface is on average .2 CoF. Comparatively the industry standard black nitride coated BCG is around .5 CoF. PVD is more than twice as smooth as the current industry standard. In addition to lubricity, the coating provides added surface level hardness to the parts which can exceed 100HRC on the rockwell C scale. A standard steel file has a hardness of around 60 HRC.

The natural hardness and lubricity of PVD lends itself to other benefits beyond just extending the life of working components; it provides a surface that is highly resistant to corrosion, easy to clean and has an extreme resistance to heat which makes it a perfect coating for any steel or titanium parts including suppressors and other muzzle devices.
