### RF Chart

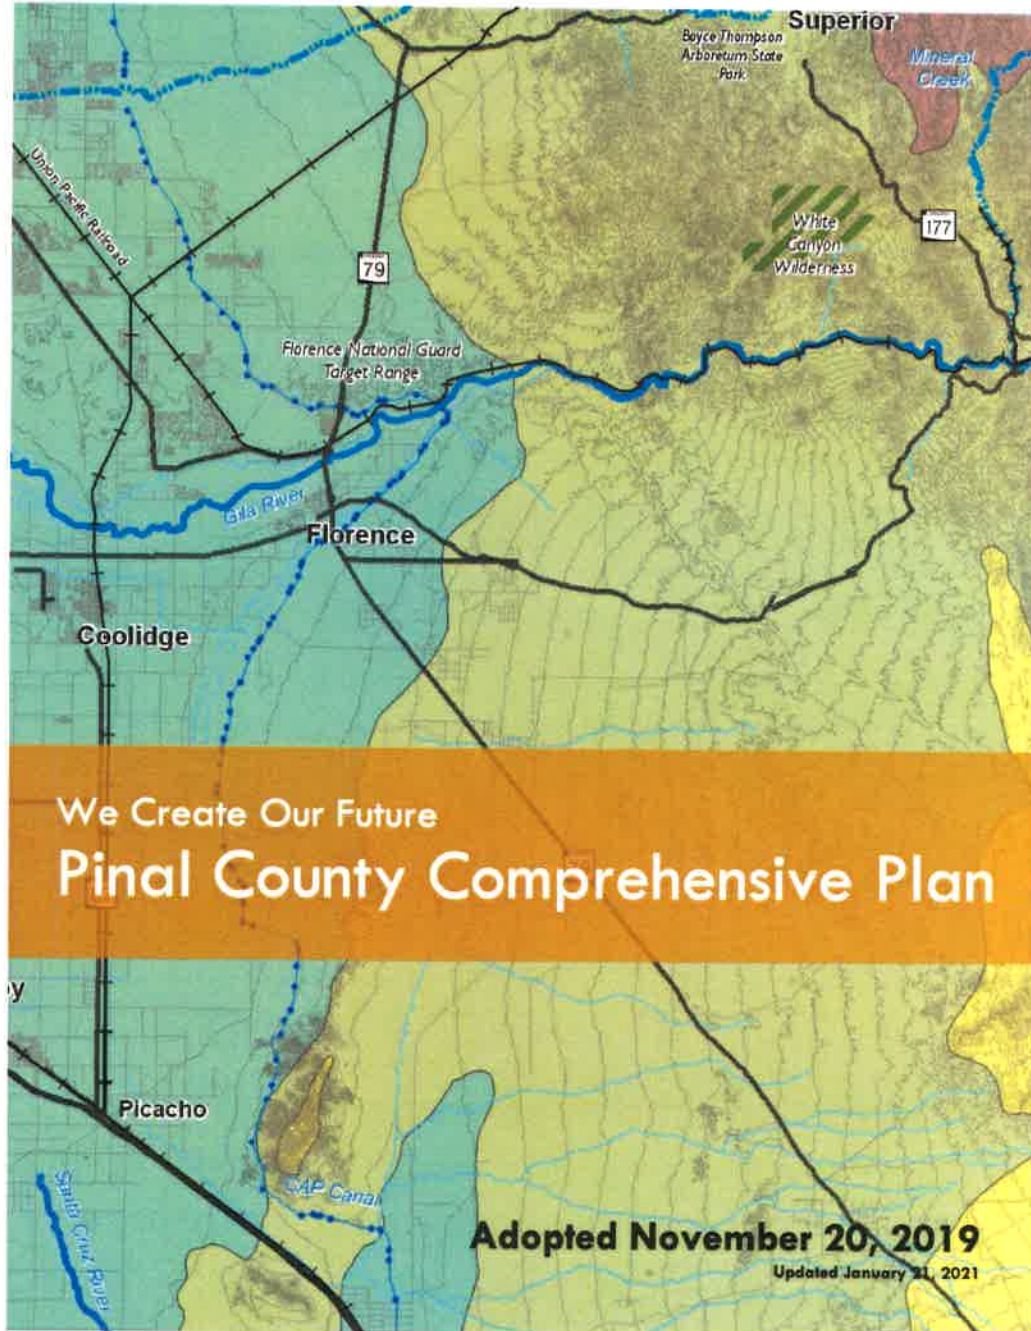

**Bluetooth devices** and **Wi-Fi routers** will emit relatively low RF power levels, given their proximity to users.

**Smartphones** can have higher power levels when in use, especially during calls or data transmission.

**Microwave Ovens** have the highest emission levels among household devices, but this is contained within the oven, and leakage is minimal and regulated.

**Cell Tower's** effective power level at a standard distance (assumed here as nearby, around 100 meters) is shown to be comparable to low-power household devices due to the distance effect, despite the tower's much higher actual power output.

4-5: Multimodal Circulation Plan: Rail, Transit and Aviation
